

The `lips` LaTeX package

Chicago Manual text ellipses (Frankenstein's lips)

Matt Swift <swift@alum.mit.edu>

Version: 2.1 Date: 2001/08/31

Documentation revision: 2001/08/31

Abstract

The `\lips` command generates text ellipses that are closer to what *Chicago Manual of Style* suggests than what `\dots` produces. It does the right thing in most circumstances, and so is easy to use.

Part I

Discussion

1 Text Ellipses

`\lips` The macro `\lips` should be used for all text ellipses, that is, ellipses not part of a mathematical expression.

Chicago Manual does not acknowledge different spacings after different marks of punctuation, distinguish interword from intersentence space, or give rules about where to break a line near an ellipsis. Given a context where such spaces do vary and rules for linebreaks can be given, I arrived at the following rules for handling them around ellipses.

1. Pre-, post-, and intra-ellipsis space is normal intra-word space, which should be 3-to-em. In \LaTeX there is also some glue (it’s a “rubber space”).
2. When non-period punctuation p follows `\lips`, p is followed by the space that normally follows p .
3. A period following `\lips` is treated as if the period preceded `\lips`. Conceptually, an ellipsis never precedes a period, so conceptually there is only one case; but it is convenient to be able to type either `\lips.` or `.\lips`.
4. Lines are a tiny bit breakable before ellipses and a tiny bit breakable after ellipses that are not followed by punctuation.

In figure 1 are examples of correct usage and in figure 2 is a comparison of `\lips` to `\dots`. You can substitute any of the characters `!"()*+,-/:;=?@[] ’ ‘|<>~{ }` for the exclamation point in the examples. There can be additional contiguous spaces after `\lips`, just like after any command name. There can also be contiguous spaces before `\lips`.

2 Line breaking considerations

`\LPNobreakList` When `\lips` is followed by certain punctuation (`, : ; ? ! ’] }`/ by default), we never

source	result
Hello\dotsc And	Hello... And
Hello\lipsc And	Hello... And
Hello\dotsc And	Hello... And
Hello\lipsc And	Hello... And
Hello.\dotsc And	Hello... And
Hello.\lipsc And	Hello... And
Hello.\dotsc And	Hello... And
Hello.\lipsc And	Hello... And
one,\dotsc,three	one,..., three
one,\lipsc,three	one,..., three
one,\dotsc,three	one,..., three
one,\lipsc,three	one,..., three
Hello\dotsc and	Hello... and
Hello\lipsc and	Hello... and
Hello\dotsc and	Hello... and
Hello\lipsc and	Hello... and
Hello!\dotsc And	Hello!... And
Hello!\lipsc And	Hello!... And
Hello!\dotsc And	Hello!... And
Hello!\lipsc And	Hello!... And

Figure 2: Comparison of `\lips` with `\dots`.

want to break a line after the ellipsis and before that punctuation. For the other punctuation, such as open parenthesis and open quote, we want normally breakable space following the ellipsis. `\LPNobreakList` is a list of those characters before which `\lips` should *never* break a line. To force unbreakable space following `\lips`, follow `\lips` with a tie (`~`).

3 Limitations

`\lips` does the right thing after `\par`, but after `\indent` or `\noindent` there is an extra preceding space (see the final section on testing for an example). Suggestions on how to handle this problem are welcome.

Part II

Implementation

4 Version control

```
\fileinfo These definitions must be the first ones in the file.
\DoXUsepackage 1 \def\fileinfo{Chicago Manual text ellipses (Frankenstein's lips)}
\HaveECitationS 2 \def\DoXPackageS {}
\fileversion 3 \def\initelyHaveECitationS {}
\filedate 4 \def\fileversion{v2.1}
\docdate 5 \def\filedate{2001/08/31}
\PPOptArg 6 \def\docdate{2001/08/31}
7 \edef\PPOptArg {%
8 \filedate\space \fileversion\space \fileinfo
9 }
```

If we're loading this file from a `\ProcessDTXFile` command (see the *compsci* package), then `\JustLoadInformation` will be defined; otherwise we assume it is not (that's why the FunkY NamE).

If we're loading from `\ProcessDTXFile`, we want to load the packages listed in `\DoXPackageS` (needed to typeset the documentation for this file) and then bail out. Otherwise, we're using this file in a normal way as a package, so do nothing. `\DoXPackageS`, if there are any, are declared in the `dtx` file, and, if you're reading the typeset documentation of this package, would appear just above. (It's OK to call `\usepackage` with an empty argument or `\relax`, by the way.)

```
10 \makeatletter% A special comment to help create bst files. Don't change!
11 \@ifundefined{JustLoadInformation} {%
12 }{% ELSE (we know the compsci package is already loaded, too)
13 \UndefinedCS\JustLoadInformation
14 \SaveDoXVarS
15 \eExpand\cname DoXPackageS\endcsname\In {%use \cname in case it's undefined
16 \usepackage{#1}%
17 }%
18 \RestoreDoXVarS
19 \makeatother
20 \endinput
21 }% A special comment to help create bst files. Don't change!
```

Now we check for L^AT_EX₂_ε and declare the LaTeX package.

```
22 \NeedsTeXFormat{LaTeX2ε}
23 \ProvidesPackage{lips}[\PPOptArg]
```

5 The macro

```
\Lips If we're in math mode, raise an error. If we're in vertical mode, leave it and do an
\BracketedLips ellipsis not breakable at the end. If we're in horizontal mode, call \lp@lips@hmode.
\lips Normally I would use \NewRobustCommand, but this seems not enough reason
\olips to require the moredefs package. We reserve the name \lips by hand. In the
future, this package may require moredefs.
24 \newcommand*\Lips {}
```

```

25 \let\Lips\relax
26 \DeclareRobustCommand\Lips {%
27   \ifmmode
28     \def\sc@t@a {%
29       \PackageError{lips}
30       {Don't use \protect\lips \space in math mode; use \protect\dots.}\@ehc
31     }%
32   \else
33     \ifvmode
34       \def\sc@t@a {%
35         \leavevmode
36         .\nobreak\ .\nobreak\ .\nobreak\ %
37       }%
38     \else
39       \let\sc@t@a\lp@lips@hmode
40     \fi
41   \fi
42   \sc@t@a
43 }
44 \newcommand*\BracketedLips {}
45 \let\BracketedLips\relax
46 \DeclareRobustCommand\BracketedLips {%
47   \ifmmode
48     \def\sc@t@a {%
49       \PackageError{lips}
50       {Don't use \protect\lips \space in math mode; use \protect\dots.}\@ehc
51     }%
52   \else
53     \ifvmode
54       \def\sc@t@a {%
55         \leavevmode
56         [.\nobreak\ .\nobreak\ .]\nobreak\ %
57       }%
58     \else
59       \let\sc@t@a\lp@blips@hmode
60     \fi
61   \fi
62   \sc@t@a
63 }

```

To do: need the relax to avoid mistaking as optarg in some contexts?

In MLA style, that is, with the mla option, \lips gives you brackets, meaning you To get no brackets, use \olips for “original lips,” that is, ellipses in the original document.

To do: Better dox here. Are options case sensitive? If so, make MLA=mla.

```

64 \newlet\lips\Lips
65 \newlet\olips\lips
66 \DeclareOption{mla} {%
67   \let\lips\BracketedLips
68 }
69 \ProcessOptions

```

\lp@lips@hmode The horizontal mode case. Then we remove the last skip on the horizontal list. If
 \lp@blips@hmode the next character is a period, we want to act as if the period preceded \lips, so
 \GobbleIgnoreSpaces

we plonk down a period, a minimally-breakable space, then an ellipsis ending with normally-breakable space. This keeps the ellipsis on the same line as the sentence it follows if at all possible, but allows it to spill onto the next line if there's no other way to avoid an overfull line. Then we want to gobble up the period that's about to come, and ignore any spaces after it, since we've already inserted proper space.

If the next character is not a period, we output a minimally-breakable space and an ellipsis. To decide whether to follow it with unbreakable or normally-breakable space, we need to know more about the next character than just that it is not a period, so we `\let` it to scratch `a` and call `\lp@lips@check@punct`.

To do: document different logic with bracketed lips; how the heck to handle greater inter-sentence space?

```

70 \newcommand\lp@lips@hmode {%
71   \unskip
72   \@ifnextchar . {%
73     .\penalty9999\ .\nobreak\ .\nobreak\ .\ %
74     \GobbleIgnoreSpaces
75   }{% ELSE
76     \penalty9999\ .\nobreak\ .\nobreak\ .%
77     \futurelet\sc@t@a\lp@lips@check@punct
78   }%
79 }
80 % hmm, have to keep the check for period i guess because i don't want it in
81 % nobreaklist? because the break/nobreak is different? because it's more efficient?
82 \newcommand\lp@blips@hmode {%
83   \unskip
84   \@ifnextchar . {%
85     \penalty9999\ [.\nobreak\ .\nobreak\ .]%
86   }{% ELSE
87     \penalty9999\ [.\nobreak\ .\nobreak\ .]%
88     \futurelet\sc@t@a\lp@lips@check@punct
89   }%
90 }
91 \newcommand\GobbleIgnoreSpaces [1] {%
92   \ignorespaces
93 }

```

`\LPNobreakList`
`\lp@<punctuation>`

We'd like to use `\ifcat.\sc@t@a` for this, but that won't work when we get a command sequence in scratch `a`. Bummer. Do I really need to define all this punctuation now? It protects against something becoming an active char or otherwise changing catcodes after the *lips* package is loaded.

```

94 \newcommand*\lp@bang {}
95 \newcommand*\lp@rparen {}
96 \newcommand*\lp@comma {}
97 \newcommand*\lp@slash {}
98 \newcommand*\lp@colon {}
99 \newcommand*\lp@semic {}
100 \newcommand*\lp@q {}
101 \newcommand*\lp@rbrack {}
102 \newcommand*\lp@rquote {}
103 \newcommand*\lp@tilde {}
104

```

```

105 \let\lp@bang=!
106 \let\lp@rparen=)
107 \let\lp@comma=,
108 \let\lp@slash=/
109 \let\lp@colon=:
110 \let\lp@semic;
111 \let\lp@q=?
112 \let\lp@rbrack=]
113 \let\lp@rquote='
114 \let\lp@tilde=~
115
116 % \egroup
117

```

I'm making an attempt to put these in order of expected frequency. A doublequote could be at the beginning or end of a quotation, so half the time you'll have to correct by adding {}, so let's leave it out so there's one less to check.

```

118 \newcommand \LPNobreakList {%
119   \lp@comma \lp@colon \lp@semic
120   \lp@q \lp@bang
121   \lp@rparen \lp@rquote \lp@rbrack \egroup
122   \lp@slash
123 }

```

`\lp@lips@check@punct` Add nonbreakable space if scratch a is in `\LPNobreakList`; add normally-breakable space otherwise. Add no space at all if scratch a is a tie—the tie will add non-breakable space. We use just the guts of `\@tfor` for efficiency.

```

124 \newcommand\lp@lips@check@punct {%
125   \ifx\sc@t@a\lp@tilde
126   \else
127     \@tempswatruue
128     \let\@fortmp\PunctList
129     \expandafter\@tforloop\LPNobreakList\@nil\@nil\@@\reserved@a {%
130       \ifx\sc@t@a\reserved@a
131       \@tempswafalse
132       \@break@tfor
133         \fi
134       }%
135     \if@tempswa
136       \ %
137     \else
138       \nobreak\ %
139     \fi
140   \fi
141 }

```

You might want to compare the L^AT_EX version (as of 95/12/01). `\fontdimen3` is the interword stretchability, not interword space.

```

\DeclareTextCommandDefault{\textellipsis}{%
. \kern\fontdimen3\font
. \kern\fontdimen3\font
. \kern\fontdimen3\font
}

```

```
\def\mathellipsis{\mathinner{\ldotp\ldotp\ldotp}}
\DeclareRobustCommand{\dots}{%
  \ifmmode\mathellipsis\else\textellipsis\fi
}
\let\ldots\dots
```

Part III

Testing

6 Ante-\lips

This is some testing. We need some text here as the first paragraph after the `\section`.

```
: . . .
: . . . text.
: . . . )
; . . .
; . . . text.
; . . . )
! . . .
! . . . text.
! . . . )
t . . .
t . . . text.
t . . . )
T . . .
T . . . text.
T . . . )
, . . .
, . . . text.
, . . . )
. . . and (\par \lips and)
and (\par and)
. . . (\par\indent \lips and)
and (\par\indent and)
. . . and (\par\noindent \lips and)
and (\par\noindent and)
And . . .
(And.\lips \par)
And.
(And. \par)
```

7 Post-\lips

`\lips` before a tie: One two three. . . . tiedtolips (I doubt you'd want to do this.)
`\lips` before `)`, e.g., punctuation transparent to spacefactors:
(One two three. . . .) This follows the `)` with interword space, to compare.
(One two three. . . .) This should follow the `)` with intersentence space.
(One two three. . . .) This should follow the `)` with intersentence space.
`\lips` before shortverb: . . . shortverb verbatim stuff
`\lips` before `\textsf`: . . . sansserif

`\lips` before `\\`: . . .
second line of a `center` environment

`\lips` before `\#`: . . . #
`\lips` before `<`: . . . j
`\lips` before an abbrev: . . . **Frankenstein**
`\lips` before `\cite`: . . . (University of Chicago Press 1993)
`\lips` before `$`: . . . $f = ma$
`\lips` before `&`: . . . second column of a `tabular`
